

“Le Our goals

The Ardolino Engineering Associate Firm and the S.p.I. S.a.s. constitute an Organization aimed at providing professional services in the field of civil construction and related activities. Our prerogatives are:

- vast experience gained in 50 years of professional activity;
- versatility in the field of civil construction, including construction and industrial design, structural design and fire prevention, the inclusive construction management of safety management in working environments, the role of project manager and procurement;
- civil planning and related works management in the cableway field;
- side activities such as: private and judicial appraisals, consultancy, estimates, static, technical-administrative, litigation management with participation in arbitration, and project audits.

In carrying out the described activities, we have always been characterized by the utmost professional honesty, understood as correctness alien from any personal interest and the use of experience gained to deal with situations of conflict using the right balance.

We have always paid particular attention to the professionalism and selection of our collaborators, who stand out for their operational flexibility and for their strong connection with our organization.

We are characterized by the particular care we take in the design phase and in our choice of construction materials, a choice geared to executive optimization.

We also devote much effort and great attention to direct assistance to the customer both in the tendering phase and on the construction site; finally, we give great importance to professional training, in order to always advise the best technical solutions.

Our clients belong to both the private sector (construction companies, societies, companies in general) and the public sector. The first demand quality to optimize their initiatives in the implementation phase, with adequate planning, assistance and account-

ing of the works, both in the phase of adjudicating the works and in the management phase; in addition, the latter require compliance with regulations concerning public works, containment of litigation and a final product free from construction defects, resulting in a reduced need for maintenance.

Both seek professionalism and competence in our organization.

All this is aimed at satisfying the client, both from a strictly technical point of view by making the most appropriate design choices for the work, and from an economic point of view by proposing solutions and materials with the highest price/quality ratio; only this assumption allows us to guarantee the continuity of the collaboration relationships and the possibility of acquiring new assignments, indispensable elements for the maintenance and development of our organization.

Another objective that we propose is of a technical nature: to minimize errors in the design phase, in order to guarantee a realization of the work within the set time-scales and keeping within budget.

Furthermore, to support the first two objectives, we intend to develop a process of optimization of the internal organizational structure and of the ability to plan the activities that are carried out.

Finally, we carefully monitor the business risks, paying particular attention to the economic-financial management of the individual orders as well as the entire organization.

In order to achieve, guarantee and improve the aims we have set ourselves, we intend to set up an organization that, based on our current strengths, is projected to constant professional growth, to continuous IT and technological updating, to the development of new skilled collaborations, to the rationalization and optimization of internal procedures, and to the evaluation of new professional and business opportunities.
